```
User Commands
       The default signal for kill is TERM. Use -1 or -1 to list available signals. Particularly useful signals
       include HIP INT KILL STOP CONT and a Alternate signals may be specified in three ways: -9 -SIGKILL
       or -KILL. Negative PID values may be used to choose whole process groups; see the PGID column in ps com-
              Specify the signal to be sent. The signal can be specified by using name or number. The behavior
             Use sirgueue(3) rather than kill(2) and the value argument is used to specify an integer to be sent
             with the signal. If the receiving process has installed a handler for this signal using the SA_SIG-
             INFO flag to signation(2) then it can obtain this data via the si value field of the significat
             List signal names. This option has optional argument, which will convert signal number to signal
             name, or other way round
       NOTES Your shell (command line interpreter) may have a built-in kill command. You may need to run the
              command described here as /bin/kill to solve the conflict.
              Translate number 11 into a signal name.
              Send the default signal, SIGTERM, to all those processes,
Manual page kill(1) line 1 (press h for help or a to quit)
```

. 10:

```
df - report file system space usage
     This manual page documents the GNU version of df. df displays the amount of space available on the file
     system containing each file name argument. If no file name is given, the space available on all currently
     mounted file systems is shown. Space is shown in IK blocks by default unless the environment variable
     POSIXIY CORRECT is set, in which case 512-byte blocks are used.
     If an argument is the absolute file name of a device node containing a mounted file system, df shows the
     space available on that file system rather than on the file system containing the device node. This ver-
     sion of df cannot show the space available on unmounted file systems, because on most kinds of systems, do-
     Show information about the file system on which each FILE resides, or all file systems by default.
            include pseudo, duplicate, inaccessible file systems
            scale sizes by SIZE before printing them; e.g., '-BM' prints sizes in units of 1,048,576 bytes; see
            print sizes in powers of 1808 (e.g., 1.1G)
            list inode information instead of block usage
Manual page df(1) line 1 (press h for help or g to quit)
```

dt du

21/27

```
User Commands
          end each output line with NUL, not newline
          print apparent sizes rather than device usage; although the apparent size is usually smaller, it may
          be larger due to holes in ('sparse') files, internal fragmentation, indirect blocks, and the like
          scale sizes by SIZE before printing them: e.g., '-BM' prints sizes in units of 1.048.576 bytes; see
          mand line argument: --max-depth=0 is the same as --summarize
          summarize device usage of the NUL-terminated file names specified in file F: if F is -. then read
          list inode usage information instead of block usage
anual page du(1) line 1 (press h for help or q to quit)
```

. 12: man df

```
sadavihdov@dk2n25 ~ $ man df
sadavihdov@dk2n25 ~ $ man du
sadavihdov@dk2n25 ~ $
```

. 13: man du
